

Plagron - Royalty-mix

This special potting soil was developed in Holland and is, in our opinion, the best soil for organic cultivation. It consists of White peat, Baltic peat, Irish peat, sphagnum peat moss and Black peat comprising 60% of the total volume. The remainder consists of 20% worm compost, 15% perlite and 5% bio super mix which is a concentrated selection of biological fertilisers containing minerals, bacteria, vitamins, blood-meal, bone-dust, basalt-dust, bentonite, seaweed meal, guano and lava-dust. The complete mix is a ready to use, completely biologically mixed potting compost with a pH between 5.9-6.2 and an EC of 1.3.

The compost will only need water for the first 5-6 weeks of cultivation because of the amount of nutrient already present in the compost.
