

Hydrokorrels

Leca is the horticultural name for the product many of us know as Growrox, Hydroton, Hydrokorrels and Geolite. Leca are kiln-fired clay pebbles from Holland. Their neutral pH and excellent capillary action qualities make them a great hydroponic medium. Preferred by horticulturalists for hydroculture, this product offers many advantages when compared to soil. The medium is clean, odor-free, reusable, and provides excellent aeration. This highly porous growing medium is used to fill plant baskets and container gardens and provides good physical support for roots. Leca is also a useful additive to Coco Medium and Soil when growing in Pot Culture and also anywhere where extra drainage is needed. Hydrokorrels prevents rotting, excess acidity, and soil pests. Great for aeroponic, NFT, and GHE Waterfarm/Dutchpot systems.
