

Canna - Rhizotonic

Canna Rhizotonic is a powerful, algae based, vegetative stimulator for roots of fast-growing plants that already have roots or root initials. Rhizotonic stimulates further root development, increases the plant's resistance to disease and promotes its inner and outer strength.

Rhizotonic is 100% natural, and contains multiple vitamins. Rhizotonic influences the root environment and is the ideal supplement for the crop environment created by the grower. Rhizotonic has a calming effect on plants, and is ideally suited for use when shipping or re-potting plants. Rhizotonic will also improve plants that are unhealthy or poorly developed. Rhizotonic can be used regardless of the type of medium. It is suitable for cultivation in potting soil and hydro culture. Rhizotonic is often sprayed on leaves and can be used as a simple means for raising the pH level in fertilizer tanks.

Rhizotonic adds more than 60 microbiological substances that considerably speeds up the growth of a balanced root environment. Various trace elements and vitamins such as B1&B2 have been added to Rhizotonic in to stimulate the plant production of hormones and root growth, thus providing better and stronger roots.
