

Dimlux - Plant Temperature Camera

The OptiClimate Plant temperature camera can be connected to the system to keep an eye on the evaporation of the crop. Too high a temperature of the plant is a sign that the plant evaporates difficult (for example, with too little not enough water or too much light). In that case, the DimLuxen are dimmed or even shut down so the plant temperature can adjust to an acceptable level. If this is not done, the plant closed its evaporation stomas, and the intake of CO2 and the photosynthesis come to a standstill. At that point the plant is not producing anymore.

For the plant the plant temperature is more important than the room temperature.
