

SMSCOM - Twincontroller - EU

The SMSCOM TwinController Pro represents a real step forwards in automatic temperature control. Unlike other controllers that simply shunt fans from idle to full speed after temperature is exceeded, the Twin Controller automatically calculates the exact running speed for your fans to maintain the temperature you set.

With the additional programme added to its software to remove excess humidity from the growroom during the lights off cycle.

When the lights in the growroom switch off, the SMSCOM Twin Controller PRO will automatically switch to another programme that every hour, gently increases the fans speed for just long enough to remove excess humidity from the room.

When the lights come back on, the Twin Controller PRO switches back to its main programme. The secondary programme can be activated at anytime so the grower can chose to use this function at any stage of the growing cycle. When not activated the controller acts in exactly the same way as the original Twin Controller both day and night.
