

Light Rail - 183cm

Light Rail is a system for longitudinal movement of the lighting kit. It is a very effective system to spread light and cover more surface of the greenhouse, using less lighting equipment and, therefore, consuming less energy.

It adapts to any growing area and can hold several lights at a time, supporting a maximum weight of 22 Kg.

Intellidrive has a timer control that lets you control the stopping time on the sides. It can move from side to side or stop up to 60 seconds every time it reaches the end of each side of the rail.

It is a very resistant system, it only consumes 5 W. It is noiseless and maximizes the efficiency of light in the greenhouse.
